

Basket Screen

Basket screens are quite simple and low-cost equipment, often used in small-scale treatment plants. Basket screens are used as pre-treatment to protect the equipment behind the line against possible damage and increase the efficiency of the treatment process.

This type of screens are connected to the guide rails on the wall. One side of the basket screen is used as the "water inlet hole". It can be lifted by a rope system to be cleaned. Due to this feature, basket grids can be easily used in deep structures.

Arsimak offers two operation types for basket screens, , manual and electric lifting devices hoist. On the other hand, these basket screens can be manufactured from perforated plates or screen bars.

Arsimak basket Screens are mainly made up of basket frame, screening filter, guide rails, cable and lifting hoist.

Specifications	
Material	AISI 304 - 316
Bar spacing	10 mm - 100 mm
Screen width	300 mm - 2500 mm
Screen height	300 mm - 2500 mm

* For special dimensions, please consult Arsimak.
